1. Programming Languages (5 points)

List the programming languages use in your project, where you use them (what components of your project) and your reason for choosing them (whatever that may be).

Python for backend development, server logic, authentication and database operation. HTML used for structuring the web pages and user interfaces. CSS for stylistic purposes of web pages.

2. Platforms, APIs, Databases, and other technologies used (5 points)

List all the platforms, APIs, Databases, and any other technologies you use in your project and where you use them (in what components of your project).

Flask was used to build the web app and manage routing. SQLite is used as the project database.

3. Execution-based Functional Testing (10 points)

*Describe how/if you performed functional testing for your project (i.e., tested for the **functional requirements** listed in your RD).*

Verify users can log in with valid credentials, test error handling for an incorrect password, confirm successful log out, verified dashboard loads, tested navigation between pages

4. Execution-based Non-Functional Testing (10 points)

*Describe how/if you performed non-functional testing for your project (i.e., tested for the **non-functional requirements** listed in your RD).*

Measured page load times to validate responsiveness, check form validation for incorrect inputs, test system behavior with multiple users

5. Non-Execution-based Testing (10 points)

Describe how/if you performed non-execution-based testing (such as code reviews/inspections/walkthroughs).

Group discussions of design decisions, walkthroughs of authentication logic
